## COOPERS EXHIBITIONS LTD

This recycled propolyne floor can be used for temporary office environments, residential offices, displays and anywhere there are cables to be hidden. The system weighs 5kg per meter and is only twenty meters thick, but has the facility to run power/AV cables underneath. It consists of modules which fit together with a live hinge, allowing the floor to roll up and go in a transport case (easy to lay, easy to transport and easy to store). By removing one of these tiles you can position your power/AV/IT exactly where you need it. The surface of the tile has raised, textured circles to take the wear and tear of footfall, while the larger visible area is high-gloss, to ensure longevity.
